

Report – Project 1

Dargo Wang

Problem: While practicing the commands, failed to delete a non-empty folder.

Solution: Searched online and learnt “`$rm -rf [foldername]`” command

Problem: After writing files like `.git` or `.gdbinit`, couldn’t find them.

Solution: Asked others for help and learnt they are hidden files. Need to list them by “`$ls -a`”.

Problem: When starting the gdb debugger, just type “`$gdb`” and then “`#run`” it. It showed that there was no execution file running.

Solution: gdb doesn’t know which file to run, even though you have already written “file [filename]” in `.gdbinit`. You need to type “`$gdb [filename]`” or “`$gdb #file [filename]`” to let it know the file you want to run.

Problem: About git commit.

Solution: You can’t commit to local repository directly after you edit some file. You need to stage the file first.
